1. Introduction

This document describes the CSRmesh™ Bridge on-chip application built using the CSR µEnergy® Software Development kit (SDK).

The application demonstrates the following use cases:

- CSRmesh GATT Bridge: The Bridge application implements the CSR custom Mesh Control Service. This
 service allows a Bluetooth Smart enabled Phone to connect using the Mesh Control GATT service to
 send and receive CSRmesh messages to other devices
- The CSRmesh Bridge Application is provided as part of the CSRmesh release to demonstrate CSR custom defined Mesh control service in GATT server role.

The application uses the CSRmesh library which is provided as part of the CSRmesh release. See *CSRmesh Library API* documentation for details.

The CSRmesh Bridge Application is not compatible with the previous releases of CSRmesh

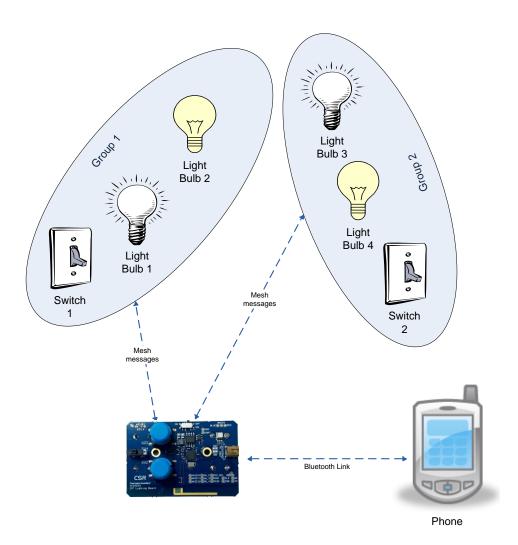

Figure 1.1: CSRmesh Use Case

1.1. Application Overview

The CSRmesh Bridge application uses the *CSRmesh Library API* to communicate with other devices that are associated within the CSRmesh network. Additionally it also supports a custom profile to allow control of the

CSRmesh from a Bluetooth Smart enabled device. This application demonstrates a Bridge use case and itself does not support association with the CSRmesh.

1.1.1. Profiles Supported

The CSRmesh applications referred to in section 1 implement the following CSR custom profile to support the use cases described in section 1.

1.1.1.1. CSRmesh Control Profile

The CSRmesh Control Profile defines the behaviour when

- A network of devices (lights and switches) needs to be created.
- Controlling the device after a network has been created. For example, Switching on/off, Intensity or the Colour of a light.
- Read the status of a device in network, i.e. on/off state, Colour or Intensity of a Light device.

The Profile defines the following two roles:

Role	Description	
CSRmesh Bridge Device	It receives commands from host and sends them over the CSRmesh network to associated devices. It receives responses from associated devices over the CSRmesh and forwards them onto the host over a BLE connection.	
CSRmesh Control Device	The CSRmesh Control Device provides the interface to create a network of devices and to control the associated devices. The control commands are sent over a Bluetooth connection to the CSRmesh Devices.	

Table 1.1: CSRmesh Control Profile Roles

The CSRmesh Bridge Device role is implemented on the CSRmesh Bridge Application. The CSRmesh Control Device is implemented on a Bluetooth Smart enabled phone or a tablet.

1.1.2. Application Topology

The CSRmesh Bridge uses the following topology:

Role	Mesh Control Service	GAP Service	GATT Service	Device Information Service
GATT Role	GATT Server	GATT Server	GATT Server	GATT Server
GAP Role	Peripheral	Peripheral	Peripheral	Peripheral

Table 1.2: Application Topology

Role Responsibility	
GATT Server	It accepts incoming commands and requests from a client and sends responses, indications and notifications to the client.
GAP Peripheral	It accepts connection from remote device and acts as a slave in the connection.

Table 1.3: Role and Responsibilities

For more information about GATT server and GAP peripheral, see Bluetooth Core Specification Version 4.1.

1.1.3. Services supported in GATT Server Role

The application exposes the following services

- Mesh Control Service (Version 2.0)
- GATT Service
- GAP Service
- CSR OTA Update Application Service Characteristics (Version 2.0)

The Mesh Control Service is mandated by the CSRmesh Control Profile. The GATT and GAP Services are mandated by the *Bluetooth Core Specification Version 4.1*.

See Figure 1.2 for the services supported in the GATT Server Role.

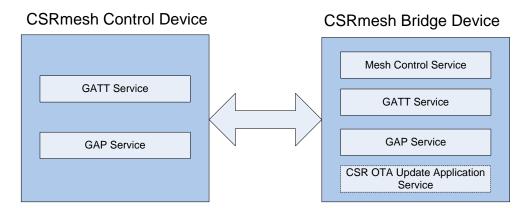

Figure 1.2: Primary Services

1.1.3.1. CSR OTA Update Application Service

The CSR OTA Update Application Service allows the application software to be updated without the need of a wired connection between the device being updated and the device providing the update. A PC or mobile phone application provided by the device manufacturer can allow the end user to keep their device up-to-date with the latest features and bug fixes. See OTA Update System Application Note for more information.

To enable a device for future OTA updates, application needs to:

- Add OTA Update functionality to the on-chip application
- Support for the CSR OTA Update Application Service and GATT Services must be added to an application. See Modifying an Application to Support OTA Update Application Note.
- Configure the on-chip bootloader
- The CSR OTA Update bootloader image needs to be present on the device and configured to contain the correct device name and (optional) authentication key, see OTA Update System Application Note.

When the device is enabled for OTA Update, the CSR µEnergy Over-the-Air Updater host application included in the SDK can be used to update the device, see OTA Update System Application Note.

2. Using the Applications

This section describes how the CSRmesh Bridge application can be used with CSRmesh Android Application to control devices.

2.1. Demonstration Kit

This application can be demonstrated using the following components.

Component	Hardware	Application	
Bridge Device	IOT Lighting Board DB- CSR1010-10185-1A	CSRmesh Bridge Application v1.0	
CSRmesh Control Device	Android Bluetooth LE Device	CSRmesh Android Application v1.0	

Table 2.1: CSRmesh Components

2.1.1. CSRmesh Development Board

The μ Energy SDK is used to download the CSRmesh Bridge application on the development boards. See the *CSR* μ Energy xIDE User Guide for further information.

Ensure the development board is switched on using the Power On/Off switch. Figure 2.1 shows the switch in the Off position.

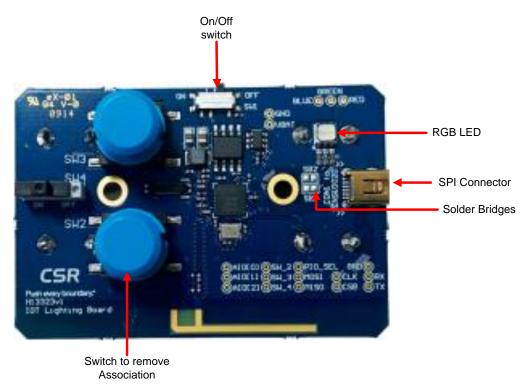

Figure 2.1: CSRmesh Development Board

Note 1:

When disconnected from the USB to SPI Adapter, wait at least 1 minute before switching the board on. This allows any residual charge received from the SPI connector to be dissipated.

Note 2:

Shorting the solder bridges allows the UART to be brought out via the USB to SPI Adapter. The PIOs connected to SW2 and SW3 are also mapped to UART Rx and Tx lines. Pressing any of these buttons will short the UART lines to ground and corrupt the data on the UART. It is recommended not to press these buttons during UART communication.

2.1.2. CSRmesh Control Application

The CSRmesh Control Application runs on a phone or a Tablet which has the Android version 4.3 or higher. It communicates with the CSRmesh devices by connecting to one of the devices which supports CSR custom defined CSRmesh Control Profile. This application is required for

- Setting up a network by associating devices
- Configuring and grouping the network devices

Note:

For details on using the CSRmesh Control Application on an Android device refer to CSRmesh 1.0 Control Application Note.

3. Application Structure

3.1.1. Source Files

The table below lists the source files and their purpose.

File Name	Purpose
csr_mesh_bridge.c	Implements all the entry functions e.g. AppInit(), AppProcessSystemEvent(), AppProcessCsrMeshEvent() and AppProcessLmEvent(). Events received from the hardware and firmware are first handled here. This file contains handling functions for all the LM and system events
csr_mesh_bridge_gatt.c	Implements routines for triggering advertisement procedures.
csr_ota_service.c	Implements the routines for handling the read/write access on the CSR custom defined Over The Air update service
gap_service.c	Implements routines for GAP service e.g. handling read/write access indications on the GAP service characteristics, reading/writing device name on NVM etc.
gatt_service.c	Defines routines for using GATT service.
mesh_control_service.c	Implements routines for handling read/write access on Mesh Control characteristics and for sending notifications of mesh device responses.
nvm_access.c	Implements the NVM read/write routines.

Table 3.1: Source Files

3.1.2. Header Files

The table below lists the header files and their purpose.

File Name	Purpose
appearance.h	Contains the appearance value macro of the application.
app_debug.h	Contains macro definitions for enabling debug prints.
app_gatt.h	Contains macro definitions, user defined data type definitions and function prototypes which are being used across the application.
csr_mesh_bridge.h	Contains data structures and prototypes of externally referred functions defined in the csr_mesh_bridge.c file.
csr_mesh_bridge_gatt.h	Contains timeout values and prototypes of externally referred functions defined in the csr_mesh_bridge_gatt.c file.
csr_ota_service.h	Contains prototypes of the externally referred functions defined in the csr_ota_service.c file.

File Name	Purpose	
csr_ota_uuids.h	Contains macros for UUID values for CSR OTA Update service	
customisation.h	Contains defines for the application data variables used by the csr_ota_service.c file.	
gap_conn_params.h	Contains macro definitions for fast/slow advertising, preferred connection parameters, idle connection timeout values etc.	
gap_service.h	Contains prototypes of the externally referred functions defined in the gap_service.c file.	
gap_uuids.h	Contains macros for UUID values for GAP service.	
gatt_service_uuids.h	Contains macros for UUID values for GATT service.	
mesh_control_service.h	Contains prototypes of the externally referred functions defined in the mesh_control_service.c file.	
nvm_access.h	Contains prototypes of externally referred NVM read/write functions defined in the nvm_access.c file.	
user_config.h	Contains macros for customising the application.	

Table 3.2: Header Files

3.1.3. Database Files

The table below lists the database files and their purpose.

File Name	Purpose	
app_gatt_db.db	Master database file which includes all service specific database files. This file is imported by the GATT Database Generator.	
csr_ota_db.db	Contains information related to CSR OTA Update service characteristics, their descriptors and values.	
gap_service_db.db	Contains information related to GAP service characteristics, their descriptors and values. See Table A.2 for GAP characteristics.	
gatt_service_db.db	Contains information related to GATT service characteristics, their descriptors and values.	
mesh_control_service_db.db	Contains information related to CSRmesh Control service characteristics, their descriptors and values. See Table A.4 for CSRmesh Control service characteristics.	

Table 3.3: Database Files

4. Code Overview

The following sections describe significant functions of the application.

4.1. Application Entry Points

4.1.1. Applnit ()

This function is invoked when the application is powered on or the chip resets and performs the following initialisation functions:

- Initialises the application timers, hardware and application data structures.
- Configures GATT entity for server role.
- Configures the NVM manager to use I²C EEPROM.
- Initialises all the services.
- Reads the persistent store.
- Registers the ATT database with the firmware.
- Initialises the CSRmesh Library.

4.1.2. AppProcessLmEvent ()

This function is invoked whenever a LM-specific event is received by the system. The following events are being handled in this function:

4.1.2.1. Database Access

- GATT_ADD_DB_CFM: This confirmation event marks the completion of database registration with the firmware. On receiving this event, the application starts advertising.
- GATT_ACCESS_IND: This indication event is received when the CSRmesh Control device tries to access an ATT characteristic managed by the application.

4.1.2.2. LS Events

- LS_CONNECTION_PARAM_UPDATE_CFM: This confirmation event is received in response to the connection parameter update request by the application. The connection parameter update request from the application triggers the L2CAP connection parameter update signalling procedure. See Volume 3, Part A, Section 4.20 of *Bluetooth Core Specification Version 4.1*.
- LS_CONNECTION_PARAM_UPDATE_IND: This indication event is received when the remote central device updates the connection parameters. On receiving this event, the application validates the new connection parameters against the preferred connection parameters and triggers a connection parameter update request if the new connection parameters do not comply with the preferred connection parameters.
- LS_RADIO_EVENT_IND: This radio event indication is received when the chip firmware receives an
 acknowledgement for the Tx data sent by the application. On receiving this event, the application aligns
 the timer wakeup (which sends data periodically to the collector) with the latent connection interval.

4.1.2.3. LM Events

LM_EV_ADVERTISING_REPORT: This event is received when an advertisement packet is received. This could be a CSRmesh advertisement. The application passes the event data to the CSRmesh library to process the packet by calling the CsrMeshProcessMessage () API.

4.1.2.4. SMP Events

SM_KEYS_IND: This indication event is received on completion of the bonding procedure. It contains keys and security information used on a connection that has completed the short term key generation. The application stores the received diversifier (DIV) and Identity Resolving Key (IRK) (if the collector device uses resolvable random address) to NVM. See Volume 3, Part H, Section 2.4 and Section 3.6 of the Bluetooth Core Specification Version 4.1.

- SM_SIMPLE_PAIRING_COMPLETE_IND: This indication event indicates that the pairing has completed successfully or otherwise. See Volume 3, Part H, Section 2.4 and Section 3.6 of *Bluetooth Core Specification Version 4.1*. In the case of a successful completion of the pairing procedure, the application is bonded with the control device and bonding information is stored in the NVM. The bonded device address will be added to the white list, if it is not a resolvable random address.
- SM_DIV_APPROVE_IND: This indication event is received when the remote connected device reencrypts the link or triggers encryption at the time of reconnection. The firmware sends the diversifier in this event and waits for the application to approve or disapprove the encryption. The application shall disapprove the encryption if the bond has been removed by the user. The firmware compares this diversifier with the one it had received in SM_KEYS_IND at the time of the first encryption. If similar, the application approves the encryption, otherwise it disapproves it.

4.1.2.5. Connection Events

- GATT_CONNECT_CFM: This confirmation event indicates that the connection procedure has completed. If it has not successfully completed, the application goes to idle state and waits for user action. See section 4.4 for more information on application states. If the application is bonded to a device with resolvable random address and connection is established, the application tries to resolve the connected device address using the IRK stored in NVM. If the application fails to resolve the address, it disconnects the link and restarts advertising.
- GATT_CANCEL_CONNECT_CFM: This confirmation event confirms the cancellation of connection
 procedure. When the application stops advertisements to change advertising parameters or to save
 power, this signal confirms the successful stopping of advertisements by the CSRmesh application.
- LM_EV_CONNECTION_COMPLETE: This event is received when the connection with the master is considered to be complete and includes the new connection parameters.
- LM_EV_DISCONNECT_COMPLETE: This event is received on link disconnection. Disconnection could be due to link loss, locally triggered or triggered by the remote connected device.
- LM_EV_ENCRYPTION_CHANGE: This event indicates a change in the link encryption.
- LM_EV_CONNECTION_UPDATE: This event indicates that the connection parameters have been updated to a new set of values and is generated when the connection parameter update procedure is either initiated by the master or the slave. These new values are stored by the application for comparison against the preferred connection parameter, see section 0.

4.2. AppProcessSystemEvent ()

This function handles the system events such as a low battery notification or a PIO change. The CSRmesh applications currently handle the following system events:

sys_event_pio_changed: This event indicates a change in PIO value. Whenever the user presses or releases the button, the corresponding PIO value changes and the application receives a PIO changed event and takes the appropriate action.

4.3. AppProcessCsrMeshEvent ()

This function handles the CSRmesh events received from the CSRmesh network. The Bridge application implements only the GATT bridge function and does not enable Device association with the network. It handles only the CSR MESH RAW MESSAGE event.

4.3.1. Raw Messages

CSR_MESH_RAW_MESSAGE: This event is received whenever the device receives a mesh message.
 CSRmesh application notifies the message to the control device on the Mesh Control Service if connected and notifications are enabled.

4.4. Internal State Machine for GATT connection

This section describes the different state transitions in the application during connection.

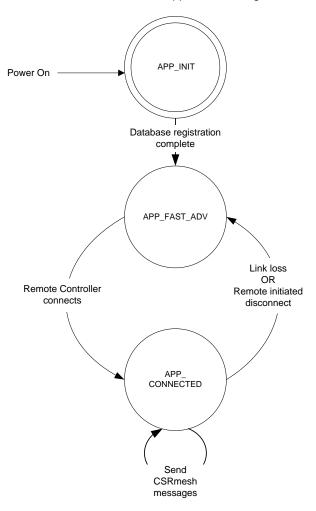

Figure 4.1: Internal GATT State Machine

4.4.1. app_state_init

When the application is powered on or the chip resets, it enters this state. The application registers the service database with the firmware and waits for confirmation. On a successful database registration it starts advertising.

4.4.2. app_state_advertising

The application starts in this state and transmits one shot advertisements every one second. If a remote collector connects to it, it stops advertisements and enters the <code>app_state_connected</code>. If the fast advertising timer expires before connection is made, the <code>app_state_idle</code> is entered. See section 6.2 for more information on advertisement timers.

While in the above state:

If the application is bonded to some remote device, it will add the bonded device's address to its white list. This means that it will accept connections only from this bonded device. While triggering advertisements, it starts a Bonded Device Advertisement Timer. If the bonded remote device connects to it within this interval, it stops advertising and enters the app_state_connected.

• If the Bonded Device Advertisement Timer expires before the remote bonded device connects to it, it stops advertising, disables the white list and again starts fast advertising for a certain interval period. If the remote collector connects to it, it stops advertisements and enters the app_state_connected. See the Bluetooth Core specification Version 4.1 for more information on white list.

4.4.3. app state connected

In this state, the CSRmesh application is connected to a CSRmesh Control device using connection intervals specified in Table 6.3. It can receive commands from the control device or send responses received over CSRmesh to control device.

- If link loss occurs, the application switches to the app state advertising state.
- In the case of a Remote triggered disconnection, it again starts advertising and enters the app state advertising state.

4.4.4. app_state_disconnecting

The CSRmesh application never triggers a disconnection on its own.

If the disconnection was triggered by then, the application will enter state app state advertising.

4.5. Synchronising with CSRmesh activity

The CSRmesh Bridge application connects to the CSRmesh control application in a bridge device role. The application has to synchronise with the CSRmesh library to avoid collision of the advertisements and connection events with the CSRmesh activity. The application calls the CSRmesh APIs to synchronise the connection radio events and the connectable advertisements with the CSRmesh library.

- The application sends connectable advertisements upon expiry of the idle timer, as long as it is not connected. Before sending the connectable advertisements the application stops the CSRmesh activity by calling the CsrMeshStop (FALSE).
- When connected, it calls the CsrMeshHandleDataInConnection(ucid, conn_interval) for the CSRmesh library to synchronise with connection events. This is called in the
 - LM_EV_CONNECTION_COMPLETE event handler
 - LS CONNECTION PARAM UPDATE IND event handler and
 - LM EV DISCONNECT COMPLETE event handler

It calls the CsrMeshHandleRadioEvent() in the $Ls_RADIO_EVENT_IND$ event handler.

This application does not support CSRmesh device association. So it does not start the CSRmesh. When it is connected to the control application it transmits the CSRmesh messages received on the Mesh Control Service over the CSRmesh and remains idle.

5. NVM Map

The application stores the parameters listed below in the NVM to prevent loss in the event of a power off or a chip panic.

Entity Name	Туре	Size of Entity (Words)	NVM Offset (Words)
Sanity Word	uint16	1	0
Bonded Flag	boolean	1	1
Bonded Device Address	structure	5	2
Diversifier	uint16	1	7
IRK	uint16 array	8	8

Table 5.1: NVM Map for Application

Entity Name	Туре	Size of Entity (Words)	NVM Offset (Words)
CSRmesh NVM	uint16 array	14	16

Table 5.2: NVM Map for CSRmesh Library

Entity Name	Туре	Size of Entity (Words)	NVM Offset (Words)
GAP Device Name Length	uint16	1	30
GAP Device Name	uint8 array	20	31

Table 5.3: NVM Map for GAP Service

Entity Name	Туре	Size of Entity (Words)	NVM Offset (Words)
MTL_CP Characteristic client configuration descriptor	uint16	1	51

Table 5.4: NVM Map for CSRmesh Control Service

Note 1:

The application does not pack the data before writing it to the NVM. This means that writing a uint8 takes one word of NVM memory.

6. Customising the Application

The developer can customize the application by modifying the following parameter values. This section provides details on how to customise some parameters of the CSRmesh application.

6.1. Advertising Parameters

The CSRmesh applications use the parameters in Table 6.1 for fast and slow advertisements. The macros for these values are defined in file <code>gap_conn_params.h</code>. These values have been chosen by considering the overall current consumption and optimum performance of the device in the CSRmesh. See *Bluetooth Core Specification Version 4.1* for the advertising parameters range. It is recommended not to change these parameters.

Parameter Name	Advertisement Interval
Minimum Advertising Interval	90 ms
Maximum Advertising Interval	90 ms

Table 6.1: Advertising Parameters

6.2. Advertisement Timers

The CSRmesh application enters the appropriate state on expiry of the advertisement timers. See section 4.4.2 for more information. The macros for these timer values are defined in the corresponding file csr_mesh_bridge_gatt.h.

Timer Name	Timer Value
Fast Advertisement Timer Value	30 ms

Table 6.2: Advertisement Timers

6.3. Connection Parameters

The CSRmesh application uses the connection parameters listed in Table 6.3 by default. The macros for these values are defined in the file <code>gap_conn_params.h</code>. These values have been chosen by considering the overall current consumption of the device and optimum performance of the device in the CSRmesh network. It is recommended to not modify this parameter. See *Bluetooth Core Specification Version 4.1* for the connection parameter range.

Parameter Name	Parameter Value
Minimum Connection Interval	90 ms
Maximum Connection Interval	120 ms
Slave Latency	0 intervals
Supervision Timeout	6000 ms

Table 6.3: Connection Parameters

6.4. Device Name

The user can change the device name for the application. By default, it is set to "CSRmesh" in the file gap service.c. The maximum length of the device name is 20 octets.

6.5. Device Address

The application uses a public address by default. The <code>USE_STATIC_RANDOM_ADDRESS</code> macro in <code>app_gatt.h</code> file can be used to enable the support for static random addresses.

6.6. Non-Volatile Memory

The application uses one of the following macros to store and retrieve persistent data in either the EEPROM or Flash-based memory.

- NVM TYPE EEPROM for I²C EEPROM.
- NVM TYPE FLASH for SPI Flash.

Note:

The macros are enabled by selecting the NVM type using the Project Properties in xIDE. This macro is defined during compilation to let the application know which NVM type it is being built for. If EEPROM is selected NVM_TYPE_EEPROM will be defined and for SPI Flash the macro NVM_TYPE_FLASH will be defined. Follow the comments given in the keyr file as per the selection above.

6.7. Application Features

This section provides details on how to customize some parameters on the CSRmesh Bridge application. The application can be configured by uncommenting the required define in the user <code>config.h</code>

Configuration	Description
ENABLE_GATT_OTA_SERVICE	Enables the CSR OTA service. With this feature enabled the user can request for firmware update over the air using the CSR OTA Update tool.

Table 6.4: Application configurations

6.8. Configuring the CSRmesh Parameters

The CS User keys can be defined in the .keyr file to override the default CSRmesh parameters. The CSRmesh Library sets the parameters based on the CS User Key values. The following table provides the recommended values for these values for optimal performance of the devices over the CSRmesh network.

CS User Key Index	Parameter	Recommended Value	Description
0	CSRmesh Transmit Interval (ms)	003C	The CSRmesh library uses this interval for transmitting messages. This is the recommended value as this allows the device with optimal time for Receiving and transmitting messages.
1	CSRmesh Transmit Time (ms)	01E0	The CSRmesh library uses this value for transmitting data over the network for this period of time. This is the recommended value for transmitting a message with high reliability.

Table 6.5: Configuring CSRmesh Parameters

Appendix A CSRmesh Application GATT Database

A.1 GATT Service Characteristics

Characteristic Name	Database Handle	Access Permissions	Managed By	Security Permissions	Value
Service Changed	0x0003	Indicate	Application	Security Mode 1 and Security Level 1	Service Changed Handle value
Service Changed Client Characteristic Configuration descriptor	0x0004	Read, Write	Application	Security Mode 1 and Security Level 1	Current client configuration for "Service Changed " characteristic

Table A.1: GATT Service Characteristics

A.2 GAP Service Characteristics

Characteristic Name	Database Handle	Access Permissions	Managed By	Security Permissions	Value
Device Name	0x0007	Read, Write	Application	Security Mode 1 and Security Level 1	Device name Default value : "CSRmesh"
Appearance	0x0009	Read	Firmware	Security Mode 1 and Security Level 1	Unknown: 0x0000
Peripheral preferred connection parameters	0x000b	Read	Firmware	Security Mode 1 and Security Level 1	Connection interval - Min 90 ms - Max 120 ms Slave latency - 0 Connection timeout - 6 s

Table A.2: GAP Service Characteristics

For more information on GAP service and security permissions, see Bluetooth Core Specification Version 4.1.

A.3 CSR OTA Update Application Service Characteristics

Characteristic Name	Database Handle	Access Permissions	Managed By	Security Permissions	Value
Current Application	0x000e	Read, Write	Application	Security Mode 1 and Security Level 2	Current live application 0x0 - OTA Update Bootloader 0x1 - Identifies application 1 0x2 - Identifies application 2
Read CS Block	0x0010	Write	Application	Security Mode 1 and Security Level 2	Format - uint16[2] Index 0 - An offset in 16-bit words into the CS defined in the SDK Documentation. Index 1 - The size of the CS block expected, in octets.
Data Transfer	0x0012	Read, Notify	Application	Security Mode 1 and Security	This characteristic is ATT_MTU-3 (20)-bytes long.

Characteristic Name	Database Handle	Access Permissions	Managed By	Security Permissions	Value
				Level 2	The format of the 20-bytes is defined by the message context.
Data Transfer Client Characteristic Configuration	0x0013	Read, Write	Application	Security Mode 1 and Security Level 2	Current client configuration for "Data Transfer" characteristic

Table A.3: CSR OTA Update Application Service Characteristics

A.4 Mesh Control Service Characteristics

Characteristic Name	Database Handle	Access Permissions	Managed By	Security Permissions	Value
Network Key	0x0016	Write	Application	Security Mode 1 and Security Level 1	0
Device UUID	0x0018	Read	Application	Security Mode 1 and Security Level 1	22e4-b12c-5042- 11e3-9618-ce3f- 5508-acd9
Device ID	0x001a	Read, Write	Application	Security Mode 1 and Security Level 1	0x8001
MTL Continuation Control Point	0x001c	Write	Application	Security Mode 1 and Security Level 1	Dynamic
MTL Continuation Control Point Client Characteristic Configuration	0x001d	Read, Write	Application	Security Mode 1 and Security Level 1	Current client configuration for "MTL Continuation Control Point" characteristic
MTL Complete Control Point	0x001f	Write, Notify	Application	Security Mode 1 and Security Level 1	Dynamic
MTL Complete Control Point Client Characteristic Configuration	0x0020	Read, Write	Application	Security Mode 1 and Security Level 1	Current client configuration for "MTL Complete Control Point " characteristic
MTL TTL	0x0022	Read, Write	Application	Security Mode 1 and Security Level 1	50
MESH Appearance	0x0024	Read, Write	Application	Security Mode 1 and Security Level 1	0

Terms and Definitions

API	Application Programmer's Interface		
	Application Programmer's Interface		
BLE	Bluetooth Low Energy (now known as Bluetooth Smart)		
BlueCore®	Group term for CSR's range of Bluetooth wireless technology chips		
Bluetooth®	Set of technologies providing audio and data transfer over short-range radio connections		
cs	Configuration Store		
CSR	Cambridge Silicon Radio		
CSRmesh™	A CSR protocol that enables peer-to-peer-like networking of Bluetooth Smart devices		
EEPROM	Electrically Erasable Programmable Read Only Memory		
GAP	Generic Access Profile		
GATT	Generic Attribute Profile		
I ² C	Inter-Integrated Circuit		
IOT	Internet of Things		
IRK	Identity Resolving Key		
LED	Light Emitting Diode		
LM	Link Manager		
MTL	Message Transport Layer		
NVM	Non Volatile Memory		
ОТА	Over the Air		
PIO	Programmable Input Output		
PWM	Pulse Width Modulation		
Тх	Transmit		
UUID	Universally Unique Identifier
